### Abstract

**Background:** *Escherichia coli* is currently a leading pathogen for deaths associated with antimicrobial resistance (AMR) [1]. AMR related to food-producing animals is a public health risk requiring a One Health approach [1,2]. Animals are major reservoirs of antibiotic resistant *E. coli* which can easily reach humans through the food chain, direct contact, or the environment [3]. **Objective:** To analyze the AMR profiles of *E. coli* in fecal samples from Holstein-Friesian cattle, as information on AMR from dairy farming in Portugal is scarce. **Methods:** Samples (n=112) collected from 7 different farms at Northern Portugal were pooled during February-March 2023 based on age group (8 calves and 8 cows per farm). Characteristic *E. coli* colonies were selected from MacConkey Agar supplemented with or without antibiotics (4 µg/ml cefotaxime; 3 µg/ml colistin), for confirmation by MALDI-TOF mass spectrometry and antimicrobial susceptibility testing (AST), according to EUCAST/CLSI guidelines. ESBL phenotype were searched using the Double-Disk Synergy Test. **Results:** Presumptive *E. coli* isolates (n=110) representing different farming production systems were obtained and 51 representatives were identified by MALDI-TOF and tested by AST. From both calves and cows, 95% and 63% of the *E. coli* isolates exhibited resistance to  $\geq 1$  antimicrobial classes and multidrug resistance (MDR, resistance to  $\geq 3$  antimicrobial classes), respectively. Isolates were mostly resistant to gentamycin (88%), ampicillin (72%), amoxicillin plus clavulanic acid (63%), tetracycline (63%) and cefotaxime (53%). Only two isolates showed susceptibility to all tested antibiotics. ESBL activity was observed in 21% of *E. coli* isolates. All analyzed pools were classified as MDR. **Conclusions:** This is one of the first studies on AMR rates of *E. coli* from dairy cattle in Northern Portugal. It reveals a high prevalence of MDR *E. coli*, which is a worrying finding and emphasize the need of a multisectoral One Health approach to minimize its impact.

**Keywords:** One Health; antimicrobial resistance; livestock; *Escherichia coli*

### Acknowledgments

This work was funded by CESPU - Cooperativa de Ensino Superior Politécnico e Universitário, under the CORE-CattleGI2-CESPU-2022 project, entitled Prevalence of colistin-resistant *Enterobacteriaceae* on intensive and non-

intensive cattle production systems. Work supported by National Funds through FCT - Fundação para a Ciência e a Tecnologia in the scope of the project UIDP/50027/2020, as well as UIDB/50006/2020 and UIDP/50006/2020.
